5. Supporting structure
6. Water level sensor
7. Emergency bypass
8. Inlet
9. Screen basket
10. Support block

Fully automatic screen with vertical transportation of screenings

DESCRIPTION

The Vertical Screw Screen is designed for municipal waste water treatment plants. The screen can be installed at plants where it is not possible to install conventional screen type due to space limitations.

This type of screw screen does not represent any compromise. The screenings are removed from waste water with the same precision as that of other screw screen types.

The automatic operation is ensured by a water level sensor which initiates cleaning of the screen basket when needed. The openings are optional.

PROPERTIES

- Catching and transportation of screenings at the smallest possible area
- Great variability of the connecting options
- Fully automatic operation
- Made of stainless steel
